ComPic – Standard Software Components

Available as a standalone product or optimised to run on a network with a server based database, such as SQL Server, the standard ComPic v6 configuration provides a comprehensive photo ID card issue and management system. This can be enhanced by the addition of optional features and may also be linked with other products from the IDentilam suite of idcardsonline software solutions: Badge & Track for recording attendance and/or authentification of card holders, Card Check for image retrieval, and ComPicWeb, a browser front end for data access and custom workflow.
